The Triassic Period

The Triassic period, spanning from 252 to 201 million years ago, marked the dawn of the dinosaur era. As the supercontinent Pangea began to break apart, new continents emerged, and the landscape transformed.

This period witnessed the rise of the first dinosaurs, such as the Eoraptor and the Herrerasaurus. These early dinosaurs were small, bipedal creatures, with long tails and sharp teeth. As the Triassic progressed, dinosaurs began to diversify, giving rise to a wide array of herbivores and carnivores.

The Jurassic Period

The Jurassic period, from 201 to 145 million years ago, was a time of great ecological change. The continents continued to drift apart, and the climate

became warmer and more humid. Lush forests covered the land, and the oceans teemed with life.

During this period, dinosaurs evolved into colossal behemoths. The Stegosaurus, with its massive bony plates, and the Brachiosaurus, with its towering neck, became icons of the Jurassic landscape. The carnivorous Tyrannosaurus rex, the largest known land predator, also emerged during this time.

The Cretaceous Period

The Cretaceous period, lasting from 145 to 66 million years ago, was the final chapter in dinosaur history. The continents had largely taken their present-day positions, and the climate continued to be warm and tropical.

The Cretaceous period saw the rise of advanced dinosaur species, such as the Triceratops, with its three horns, and the Duck-billed Hadrosaurs. Birds,

the descendants of feathered dinosaurs, also made their first appearance during this time.

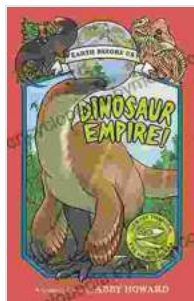

The Extinction Event

The Cretaceous period came to an abrupt end with the Chicxulub impact event, an asteroid impact that occurred 66 million years ago. The impact caused widespread devastation, triggering massive wildfires, tsunamis, and an extinction event that wiped out three-quarters of all plant and animal species on Earth.

While the dinosaurs were ultimately doomed, their legacy lives on in the fossil record and in the birds that we see today.

"Dinosaur Empire: Earth Before Us" is a captivating journey through the prehistoric past, bringing to life the extraordinary creatures that once roamed our planet. It is a testament to the beauty, diversity, and ultimate fragility of life on Earth.
